

SEQ Water - Chlorine Gas Upgrade Capalaba, Queensland

WestWater Enterprises was the successful tenderer for the Design, Manufacture & Installation of a new Chlorine Gas Dosing Plant at Capalaba Water Treatment Plant.

The old system was Fisher & Porter gear which had become old & unreliable after 20 years of service. We replaced the equipment with Severn Trent Equipment (Which is modern version of Fisher & Porter). The equipment was pulled off the wall on Friday night and commissioned on the Monday morning.

The job also involved upgrading the chlorine gas detection system and replacing the regulators on the chlorine gas drums. The job was done on time and on budget - another successful job by WestWater Enterprises Pty Ltd.

The old Fisher & Porter gas equipment had served it's time and was becoming expensive to run and also an OH&S issue. A new system had to be designed and installed.

WestWater designed and manufactured a 5 train system in the Loganholme factory, it was then transported to site and installed over a day period and commissioned on the 3rd day.

Five chlorinators & ejectors mounted on two panels with motorised actuator vales to activate which ejector they want to activate.
