WESTWATER

PROJECT PROFILE

SEQ Water - Instrumentation Upgrade

Esk Water Treatment Plant, Queensland

WestWater Enterprises was the successful tenderer for the Instrumentation upgrade at Esk Water Treatment Plant, the project involved the installation of a Siemens mag flow meter and various instrumentation including Hach (Turbidity), Yokagawa (pH & DO) Siemens Deplox 3 (Free Chlorine & pH). The system also had a sample reclaim system which returned the clean water back into reservoir. The job was completed within 3 days.

An old cabinet onsite was refurbished with raw water analysers which were mounted on a new grey PVC panel.

A new Mag flow meter was installed on the raw water supply to the clarifier, a support beam had to be installed to enable the mag flow to be removed for servicing.

A new cabinet was installed with a sample reclaim system which will reclaim all recoverable sample water and reinject into the reservoir.
